

Contoso Cloud Handbook: Getting Started

This handbook describes how Contoso engineering teams run workloads on Microsoft Azure.

All production workloads must run in the East US 2 region. Disaster recovery copies are kept in Central US.

Every resource must carry two tags: **owner** (the team alias) and **cost-center** (a five-digit code).

Security Policy

Account keys and connection strings are prohibited. Services authenticate with Microsoft Entra ID and managed identities.

Public network access to storage accounts is disabled by default. Exceptions require approval from the Cloud Security Board.

Secrets that cannot be avoided are stored in Azure Key Vault and rotated every 90 days.

Cost Management

Each team receives a monthly Azure budget of 2,500 USD. Alerts are sent at 50%, 80% and 100% of the budget.

Development environments must scale to zero outside working hours. Container Apps should use min replicas = 0.

Unused resources older than 30 days are flagged in the weekly FinOps review and deleted after 14 days' notice.
